### Additional information

Only loans granted to individuals (households excluding sole proprietors and unincorporated partnerships) by resident monetary financial institutions are presented here.

The outstanding growth rates are calculated by correcting accounting modifications that do not reflect economic changes. In particular the accounting derecognition of loans from the MFI's statistical balance sheet due to their sale, securitization or write-offs/write-downs is corrected. Conversely, exchange rate effects are taken into account without any change.

The weighted average rates and new business volumes are calculated according to the harmonized definitions of the Eurosystem. Published rates are the narrowly defined effective rate (NDER). They correspond to the interest component of the Annual Percentage Rate of Charge (APRC). Renegotiated loans also include mortgage repurchases. The production of the new loans represents the new granted loans, even when they are not actually remitted to the borrower. This method, which is common to all Eurosystem central banks, allows having an advanced indicator of loans production, which is useful particularly for economic analysis.
