## Additional information

Only loans granted to individuals (households excluding sole proprietors and unincorporated partnerships) by resident monetary financial institutions are presented here.

The outstanding growth rates are calculated by correcting accounting modifications that do not reflect economic changes. In particular the accounting derecognition of loans from the MFI's statistical balance sheet due to their sale, securitization or write-offs/write-downs is corrected. Conversely, exchange rate effects are taken into account without any change.

Monthly growth rates are those of new loans agreed, i.e. disbursed. It should not be considered as an indication for identifying any inflection point in loans' granting policy, since a delay is observed between the acceptance of the loans and its effective disbursement.

The monthly growth rates are those of the loans originated. New loan production represents new loans granted, even when they are not yet actually disbursed to the borrower, in accordance with the Eurosystem's harmonised methodology, which aims to provide the public with an indicator that rapidly reflects changes in loan production. For this reason, the production of new loans differs from monthly changes in outstanding loans because the outstanding amounts are recorded after the actual disbursement of funds and take into account the amortisation of old loans.

The weighted average rates and new business volumes are calculated according to the harmonized definitions of the Eurosystem. Published rates are the narrowly defined effective rate (NDER). They correspond to the interest component of the Annual Percentage Rate of Charge (APRC). Renegotiated loans also include mortgage repurchases.
